

# *The* **Micro Cat**

Miniature Windscreen

The **Micro Cat** miniature windscreens allow the use of lavalier microphones in windy conditions that would otherwise cause serious audio problems. They really work.

Hand-made from a fuzzy outer layer plus two additional inner layers of open weave fabric, the Micro Cat very effectively stops wind from reaching the microphone to substantially reduce wind noise while remaining sonically transparent. The elastic opening easily fits over most lav microphones with diameters of up to 12mm.

When used with narrow microphones such as the Sanken COS-11, the microphone's normal mesh windscreens are used inside the Micro Cat for a secure fit. Even the tiny Countryman B-6 works well in the Micro Cat when combined with the microphone's foam ball.

Because of the increased potential for clothing noise when concealed, The Micro Cat is best used outside the clothing, fully exposed. For long wide shots that are sometimes the reason for needing a wireless lav microphone in the first place, the Micro Cat's neutral gray color can often go completely unnoticed.

The supplied miniature screwdrivers are a convenient way of storing the Micro Cat, aiding in finding the opening and keeping them from blowing away during those windy shoots.
